

Decision Tree: Primate Choice Architecture

Mathematical representation of behavioral outcomes

$Y[ijk] \sim \text{Multinomial}(p1, p2, p3)$

$p1 = P(\text{explore}), p2 = P(\text{exploit}), p3 = P(\text{none})$

$\log(p1/p3) = a1 + X*\text{beta1} + u[i] + v[j]$

$\log(p2/p3) = a2 + X*\text{beta2} + u[i] + v[j]$

N = 1,443 decision trials
across 6 monkeys

Three-way classification
with balanced outcomes
